

Edit Videos with Google Gemini Omni

Use any multimodal AI to analyse a reference video and prepare scene prompts. Then use Google Gemini Omni to edit, transform, and recreate that visual style with your own script, visuals, or footage.

REFERENCE → SCRIPT → AI PROMPTS → OMNI EDIT → REFINE → CAPCUT

1 Find a Reference Video

Choose the style before you start generating.

Choose a video from Instagram, TikTok, Pinterest, or YouTube that has the editing style, movement, pacing, or typography you want.

- Save the video or take clear screenshots from it.
- Prepare your final script.
- Collect product or character images.
- Keep your logo, brand assets, and raw footage ready if available.

2 Create the Prompts in Any AI Model

Use ChatGPT, Claude, Gemini, or another multimodal AI.

Upload the reference video or screenshots, your script, and any product or brand references. Then paste the prompt below.

COPY THIS PROMPT

I am attaching a reference video and my own script.

Analyse the reference video and identify:
- Visual and editing style
- Camera movement
- Animation and motion
- Transitions
- Colours and background
- Typography
- Pacing
- Music and sound effects
- Opening hook
- Ending style

Then divide my script into short scenes suitable for Google Gemini Omni.

For each scene, write one copy-ready editing prompt that includes:
- What should appear on screen
- What should change from my uploaded footage or reference
- Character, product, or object movement
- Camera movement
- Background and lighting
- Animation and transitions
- Sound effects and music direction
- Short on-screen text, only when needed
- How the scene should connect to the next one

Keep the visual style consistent across all scenes.

Do not copy the original brand, logo, people, wording, or exact scene. Create an original version for my content.

My script:
[PASTE YOUR SCRIPT]

My required format:
[9:16 OR 16:9]

My preferred total duration:
[ENTER DURATION]

3 Review the Scene Prompts

Fix the plan before moving into Omni.

- Does every scene match the script?
- Is the opening strong?
- Are the visuals connected?
- Is the product or character consistent?
- Is the text short and readable?
- Is the final CTA correct?

Ask the AI to revise anything unclear before you start editing in Gemini Omni.

4 Edit in Google Gemini Omni

Work scene by scene for better control.

1	Upload the reference video, your raw footage, or your images.
2	Paste the matching scene prompt.
3	Ask Omni to transform or edit the uploaded content.
4	Keep the best version.
5	Repeat for the remaining scenes.

Important: Always attach the reference or source material when editing. Without it, Omni may generate a new style instead of following your intended visual direction.

5 Improve the Result in Chat

Make one clear change at a time.

“Keep the video the same but make the text bigger.”	*“Slow down the transition.”*
“Change the background to red.”	*“Keep the same person and clothing.”*
“Replace the product with my product.”	*“Add more camera movement.”*

“Remove the extra objects.”	*“Make the animation more energetic.”*

“Keep the first part and change only the ending.”	*“Remove all on-screen text.”*

6 Assemble the Final Video

Finish the edit in CapCut or another editor.

- Put the scenes in order.
- Add voice-over.
- Add music and sound effects.
- Add clean subtitles.
- Fix any incorrect AI-generated text.
- Add your logo and CTA.
- Export the final video.

SIMPLE WORKFLOW

Reference video → Script → Prompts in any AI → Edit in Gemini Omni → Refine in chat → Assemble in CapCut

The prompts can be created anywhere. The actual video editing and transformation happens in Google Gemini Omni.
